

Spec reference	Spec point	Additional guidance
4.5.1 Photons	(a) the particulate nature (photon model) of electromagnetic radiation	Determine the Planck constant using different coloured LEDs.
	(b) photon as a quantum of energy of electromagnetic radiation	Quantised packet of electromagnetic energy
	(c) energy of a photon; $E = hf$ and $E = \frac{hc}{\lambda}$	Photon energy $E \propto f$
	(d) the electron-volt (eV) as a unit of energy	The work done on an electron when it moves through a potential difference of 1V. $1 \text{ eV} = 1.6 \times 10^{-19} \text{ J}$ ($W = eV$ from p.d. equation).
	(e) (i) using LEDs and the equation: $eV = \frac{hc}{\lambda}$ to estimate the value of Planck constant h.	$V = hc/e \cdot 1/\lambda$ Plot V against $1/\lambda$ Gradient = hc/e Re-arrange to find h.
4.5.2 The photoelectric effect	(a) (i) photoelectric effect, including a simple experiment to demonstrate this effect	The photoelectric effect provides evidence for particulate nature of EM radiation. Light travels as wave but interacts with matter like a particle.
	(ii) demonstration of the photoelectric effect using, e.g. gold-leaf electroscope and zinc plate	Negatively charged zinc plate exposed to photons loses its charge when exposed to e.g. UV photons.

	<p>(b) a one-to-one interaction between a photon and a surface electron.</p> <p>(c) Einstein's photoelectric equation</p> $hf = \phi + KE_{\max}$ <p>(d) work function;</p> <p>threshold frequency</p> <p>(e) the idea that the maximum kinetic energy of the photoelectrons is independent of the intensity of the incident radiation</p> <p>(f) the idea that rate of emission of photoelectrons above the threshold frequency is directly proportional to the intensity of the incident radiation.</p>	<p>One photon interacts with one electron transferring all its energy to the electron.</p> <p>Conservation of energy.</p> <p>Minimum energy required to liberate a surface electron.</p> <p>No surface electron can be liberated unless the photon energy exceeds the work function.</p> <p>No electron can be liberated unless the photon's frequency exceeds the threshold frequency.</p> $\Phi = hf_{\text{threshold}}$ <p>Effect occurs even at low intensity with UV photons, but not when exposed to red light, even at very high intensity.</p> <p>Intensity = Power/Area For photon exposure: Power = number of photons/second x photon energy.</p>
4.5.3 Wave–particle duality	<p>(a) electron diffraction, including experimental evidence of this effect.</p>	<p>Electron diffraction provides evidence for wave-like behaviour of particles.</p>

	<p>(b) diffraction of electrons travelling through a thin slice of polycrystalline graphite by the atoms of graphite and the spacing between the atoms</p> <p>(c) the de Broglie equation</p> $\lambda = \frac{h}{p}$	<p>Electrons travel as waves but interact with matter as particles.</p> <p>The De Broglie wavelength of an electron with a momentum p.</p> <p>Electron diffraction occurs if $\lambda_{DB} \approx$ Gap size between atoms in crystal $\approx 10^{-10}\text{m}$.</p> <p>Interference pattern a series of bright rings – gaps between maxima dependent on path difference and therefore λ_{DB}</p>
